

FYI Solutions is proud to be a member of the Tableau Software partner network, which markets, sells, implements, and supports Tableau solutions. Tableau is a leader in Data Visualization software.

About Tableau: Fast analytics and rapid-fire business intelligence software anyone can use

What if you could answer questions as fast as you can think of them? Tableau is a breakthrough innovation that lets you ask and answer questions visually.

Key Tableau Capabilities

Tableau has a large range of functions and features. Key capabilities include:

- Web-based analytics in minutes, not days
- Multi-dimensional insights into your business
- Geographic visibility with one-click analytical map creation
- In-memory data engine makes your slow databases and files super speedy
- Compelling presentations for internal and external meetings
- Collaboration and sharing through web deployment
- Embedded interactive visualizations into applications
- Plugs into your existing IT infrastructure — fast and easy deployment, low maintenance, low total cost of ownership.

Ease of use

Tableau lets you create rich visualizations and dashboards with an intuitive, drag-and-drop interface that lets you see every change as you make it. Anyone comfortable with Excel can get up to speed on Tableau quickly.

Natively visual and faster all around

Because Tableau works with your natural ability to process data visually, you get a huge advantage: speed. Drag and drop to change your analysis. Turn on one-click highlighting to identify trends. Add filter with another click. You can shift perspectives over and over again until you find that nugget of insight into your data.

Tableau’s Data Engine is blazing fast against massive data. With Tableau, you don’t have to use any less than all the data you need. You can bring your data right onto your laptop and enjoy an exceptional interactive response time.

Direct connect and go

What if you could reach out to any database and just start analyzing it, without the need to prepare anything in advance? Old school business intelligence platforms required users to build elaborate “universes” and “cubes” and “temporary tables” before any real work could be done. Tableau eliminates those steps. In minutes, you’ll be consolidating numbers, and visualize results without any advance set-up.

Perfect mashups

Connect to data in one click and layer in a second data source with another. Want to add population data from the census to your sales data to see penetration rates? Click. Want to extend your production data with shipping data from those same dates? Click. Combining data sources in the same view is so easy it feels like cheating.

Best practices in a box

Tableau has best practices built right in. You get the benefit of years of research on the best way to represent data, from color schemes that convey meaning to an elegant design that keeps users focused on what’s important.

Analytics on the web and everywhere

Develop fast, share to thousands. You can publish interactive dashboards to the web or a secure server rapidly. Because your viewers need only a web browser to filter, sort, and answer their own questions, they become more engaged.
